

Comment from ACUS Senior Fellow Neil R. Eisner
August 17, 2020

I think it would be helpful for the Committee to discuss how the tools that could identify privacy info for screening work. That is, would these tools simply identify all 9-digit numbers or also read the words surrounding the numbers to determine whether to identify it? Would they identify "cancer," or just "I have cancer"? Would they identify a misspelling such as " I have cancor"? Etc.
